Introduction

Orthodontics and Dentofacial Orthopedics is a specialty area of dentistry concerned with the supervision, guidance and correction of the growing or mature dentofacial structures, including those conditions that require movement of teeth or correction of malrelationships and malformations of their related structures and the adjustment of relationships between and among teeth and facial bones by the application of forces and/or the stimulation and redirection of functional forces within the craniofacial complex. Major responsibilities of orthodontic practice include the diagnosis, prevention, interception, and treatment of all forms of malocclusion of the teeth and associated alterations of their surrounding structures; the design, application, and control of functional and corrective appliances; and the guidance of the dentition and its supporting structures to attain and maintain optimal occlusal relations and physiologic and esthetic harmony among facial and cranial structures.

A specialist in orthodontics and dentofacial orthopedics meets educational standards established by the Commission on Dental Accreditation of the American Dental Association (ADA) and must possess advanced knowledge in biomedical, clinical, and basic sciences. This knowledge includes the biology of tooth movement, cephalometrics, orthodontic diagnosis, treatment planning, surgical orthodontics, biomechanical principles, the effects of growth and development on tooth movement, application of orthopedic forces to dentofacial structures, and patient management and motivation.

The American Association of Orthodontists (AAO) is the leading national organization of dentists who limit their practice to orthodontics and dentofacial orthopedics and is recognized by the ADA as the sponsoring organization of the national certifying board, the American Board of Orthodontics. The membership of the AAO includes approximately 94% of practicing orthodontists in the United States. The AAO has the background, expertise, and professional responsibility to assist the dental profession and the public by developing clinical practice guidelines for orthodontics and dentofacial orthopedics. The AAO recognizes its role in upholding the public trust granted to it by presenting these clinical practice guidelines to help practitioners develop judgments on diagnosis, treatment planning, and timing of orthodontic and dentofacial orthopedic therapy. The primary concern of the AAO is the provision of high quality orthodontic care and the protection of the public.

Practice guidelines, as defined by the Institute of Medicine, are “systematically developed statements to assist practitioner and patient decisions about appropriate health care for specific clinical circumstances.”

The Orthodontic Clinical Practice Guidelines for Orthodontics and Dentofacial Orthopedics presented in this document are condition based and are related to the International Classification of Diseases, Clinical Modification, 9th Edition (ICD-9Codes). This approach recognizes the need for integrated treatment of oral and dentofacial conditions rather than isolated treatment procedures. These guidelines are also directed toward the process of patient care and outline considerations related to diagnosis, treatment, and quality of care.

These guidelines were derived from a professional consensus, based on a review of relevant clinical and scientific literature, the expert opinion of educators, and the clinical experience of practicing orthodontists. Similar documents written by other organizations and publications related to guideline development were also reviewed.

There are various professionally accepted philosophies regarding orthodontic diagnosis, treatment, and retention. Because of the nature of the doctor-patient relationship, the practitioner,
who is actively engaged in treating the patient, is in the best position to evaluate and interpret the complexities, timing, and potential efficacy from among different treatment philosophies and systems available. Deviations from these guidelines may be appropriate based on professional judgment and individual patient needs. Where a practitioner chooses to deviate from these guidelines (based on the circumstances of a particular patient or for any other reason) the practitioner is advised to note in the patient's record the reason for the procedure followed. Finally, it should be understood that adherence to these guidelines does not guarantee a successful treatment outcome.

The AAO recognizes that these guidelines may be used by insurance carriers and other payers, attorneys in malpractice litigation, and various entities with an interest in orthodontics. The Association encourages all interested persons to become familiar with the Guidelines. This document was not developed to establish standards of care or to be used for reimbursement or litigation purposes. The AAO cautions that these uses involve considerations that are beyond the scope of the Guidelines.

The professional conduct of members of the AAO is governed by the Principles of Ethics and Code of Professional Conduct of the AAO and the ADA.

Pretreatment Considerations

A screening examination may be performed to determine the nature of the orthodontic problem, and to determine if and when treatment is indicated. When treatment is indicated, a comprehensive examination must be performed that should include:

Examination

A. Chief Complaint
   The chief complaint or the reason for seeking treatment should be recorded as described by the patient, parent or legal guardian.

B. Medical and Dental History
   An appropriate medical and dental history must be obtained as a part of the initial evaluation of the patient. If treatment is to be delayed until a future date, an updated history may be necessary. Patients/parents/legal guardians should be requested to advise the orthodontist of any change in the patient's health history.

C. Clinical Examination
   A comprehensive clinical examination should include the following with all findings recorded in the patient's record:

   1. An extraoral facial assessment to determine facial form, symmetry, soft-tissue harmony, and status of the perioral musculature. This determines deviations from normal regarding a patient's sagittal, vertical, and transverse maxillofacial relationships and to assess the relationship of the dentition to the facial structures.

   2. An intraoral examination to assess the condition of the hard and soft tissues of the mouth, (including the periodontium) and the static and functional status of the patient's occlusion.

Diagnostic Records

Diagnostic records and tests will vary with the nature of the patient's condition but must be sufficient to identify the problems, formulate a diagnosis, and allow the development of an acceptable course of treatment. Where limited orthodontic procedures are anticipated, diagnostic records may vary from those associated with comprehensive care. Pretreatment unaltered diagnostic records for comprehensive orthodontic treatment should include the following to establish a baseline for documenting treatment and/or growth changes:

1. Extra and intraoral images (may include digital or video images) to supplement the clinical findings.
2. Dental casts (or digital models) to assess the inter-arch and intra-arch relationship of the teeth, to help determine arch length and width requirements, and to assess arch symmetry.
3. Intraoral and/or panoramic radiographs to assess the condition and developmental status of the teeth and associated structures, and to identify any dental anomalies or pathology.
4. Cephalometric radiographs to permit evaluation of the size, shape, and positions of the craniofacial structures and dentition, and to aid in the identification of skeletal anomalies or pathology. Three-dimensional cone-beam computer tomography (CBCT) may be used as an alternate (imaging) source to obtain dentofacial information.
5. The AAO recognizes that while there may be clinical situations where a cone-beam computed tomography (CBCT) radiograph may be of value, the use of such technology is not routinely required for orthodontic radiography.

Referral

Practitioners must make a recommendation for referral of patients to general dentists, other dental specialists, physicians, or other health care practitioners whenever, in the judgment of a practitioner, referral would be in the best interest of a patient. Technological advances such as CBCT scans fall in this category and should be assessed/read in their entirety by a qualified professional; the entire area encompassed by the scan may be the responsibility of the practitioner.

Diagnosis and Treatment

Prior to the initiation of orthodontic treatment, a diagnosis of the patient's oral health condition must be made. A diagnosis allows for the development of a treatment plan that addresses the patient's chief complaint; medical and dental history; and dental, facial, skeletal, functional, and/or psychosocial problems.

After a diagnosis has been established, a treatment plan must be developed. Such a plan will facilitate coordination of the treatment objectives and the various methods available for addressing them. The plan should include:

1. A list of the patient's dental, facial, skeletal, functional, and/or psychosocial problems.
2. A differential diagnosis which coordinates the patient/parents/legal guardian's chief complaint with the clinical findings.
3. A written documented plan for therapy which includes treatment goals, appliance selection, sequencing and timing of treatment, coordination with other health care providers, and retention.

The treatment plan should be periodically reassessed throughout treatment. This reassessment should take into consideration various limiting factors and establish short- and/or long-term objectives.

Anomalies of Jaw Size, Relationship of Jaw to Cranial Base, Dental Arch Relationship and Dental Alveolus

The following conditions may indicate the need for orthodontic or dentofacial orthopedic treatment. These conditions may be structural or functional, may appear in various combinations, and are not limited to the following. Frequently used treatment options, which may include the removal of primary or permanent teeth, are listed for each condition. Moreover, devices including headgear, osseointegrated implants, mini-screw implants, miniplates and other temporary anchorage devices may be used as adjuncts to improve facilitate the treatment outcome, in particular where maximum anchorage would be beneficial.

I. Maxillary/Dentoalveolar Hyperplasia (Large Maxilla)

A. Diagnostic Considerations

1. Anteroposterior
   a. Excess Overjet
   b. Distoclusion
   c. Asymmetry
   d. Mid-Face Protrusion

2. Vertical
   a. Long Face Height
   b. Deep Overbite
   c. Open Bite
   d. Lip Incompetency
   e. Asymmetry

3. Transverse
   a. Buccal Maxillary Cross-bite (unilateral or bilateral; functional or structural)
   b. Asymmetry

B. Treatment Options

1. Primary Dentition - Treatment Indicated Under Certain Circumstances, Appliances Vary
2. Mixed Dentition
   a. Functional/Orthopedic Appliances
   b. Fixed or Removable Orthodontic Appliances
3. Adolescent Dentition
   a. Functional/Orthopedic Appliances
   b. Fixed or Removable Orthodontic Appliances
   c. Fixed Orthodontic Appliances Adjunctive to Orthognathic Surgery
      (surgery usually performed after majority of growth completed)
4. Adult Dentition
   a. Fixed or Removable Orthodontic Appliances
   b. Fixed Orthodontic Appliances Adjunctive to Orthognathic Surgery

II. Maxillary/Dentoalveolar Hypoplasia (Small Maxilla)
   A. Diagnostic Considerations
      1. Anteroposterior
         a. Mesiocclusion
         b. Anterior Cross-bite (functional or structural)
         c. Asymmetry
         d. Mid-Face Deficiency
      2. Vertical
         a. Short Face Height
         b. Deep Overbite
         c. Open Bite
         d. Lip Redundancy
         e. Asymmetry
      3. Transverse
         a. Lingual Posterior Cross-bite (unilateral or bilateral; functional or structural)
         b. Asymmetry

B. Treatment Options
   1. Primary Dentition
      a. Functional/Orthopedic Appliance
      b. Fixed or Removable Orthodontic Appliance
   2. Mixed Dentition
      a. Functional/Orthopedic Appliance
      b. Fixed or Removable Orthodontic Appliance
   3. Adolescent Dentition
      a. Functional/Orthopedic Appliance
      b. Fixed or Removable Orthodontic Appliance
   4. Adult Dentition
      a. Fixed or Removable Orthodontic Appliance
      b. Fixed Orthodontic Appliance Adjunctive to Orthognathic Surgery

III. Mandibular/Dentoalveolar Hyperplasia (Large Mandible)
   A. Diagnostic Considerations
      1. Anteroposterior
         a. Prognathic Facial Pattern
         b. Mesiocclusion
         c. Anterior Cross-bite (functional or structural)
         d. Macrogenia
         e. Asymmetry
      2. Vertical
         a. Open Bite
b. Deep Overbite

c. Long Lower Facial Height

d. Asymmetry

3. Transverse

a. Posterior Cross-bite (unilateral or bilateral; functional or structural)

b. Asymmetry

B. Treatment Options

1. Primary Dentition - Treatment Indicated Under Certain Circumstances, Appliances Vary

2. Mixed Dentition

a. Functional/Orthopedic Appliance

b. Fixed or Removable Orthodontic Appliance

3. Adolescent Dentition

a. Functional/Orthopedic Appliance

b. Fixed or Removable Orthodontic Appliance

4. Adult Dentition

a. Fixed or Removable Orthodontic Appliance

b. Fixed Orthodontic Appliance Adjunctive to Orthognathic Surgery

IV. Mandibular/Dentoalveolar Hypoplasia (Small Mandible)

A. Diagnostic Considerations

1. Anteroposterior

a. Mandibular Retrognathic Facial Pattern

b. Excess Overjet

c. Distoclusion

d. Asymmetry

2. Vertical

a. Open Bite

b. Deep Overbite

c. Short Lower Face Height

d. Long Lower Face Height

3. Transverse

a. Posterior Cross-bite (unilateral or bilateral; functional or structural)

b. Asymmetry

B. Treatment Options

1. Primary Dentition - Functional/Orthopedic Appliance

2. Mixed Dentition

a. Functional/Orthopedic Appliance

b. Fixed or Removable Orthodontic Appliance

3. Adolescent Dentition

a. Functional/Orthopedic Appliance

b. Fixed or Removable Orthodontic Appliance

c. Appliance Adjunctive to Orthognathic Surgery (surgery usually performed after majority of growth completed)

4. Adult Dentition
Anomalies of Tooth Position, Discrepancies of Tooth Size and Arch Length

These conditions may appear in various combinations and are not limited to the following. Frequently used treatment options for these anomalies may include modification of tooth size, surgical exposure, extraction of primary or permanent teeth, and appropriate soft tissue surgery.

I. Deficient Arch Length (Crowding)

A. Diagnostic Considerations

1. Facial-Lingual Displacement
2. Supra/Infra Eruption
3. Rotations
4. Impactions
5. Axial Inclination of Teeth (Anterior or Posterior)
6. Tooth Size
7. Premature Loss of Primary Teeth
8. Ankylosis

B. Treatment Options

1. Primary Dentition
   Fixed or Removable Space Maintainer
2. Mixed Dentition
   a. Functional/Orthopedic Appliance
   b. Fixed or Removable Orthodontic Appliance
   c. Serial Extraction
3. Adolescent Dentition
   a. Fixed or Removable Orthodontic Appliance
   b. Functional/Orthopedic Appliance
4. Adult Dentition
   Fixed or Removable Orthodontic Appliance

II. Excessive Arch Length (Spacing)

A. Diagnostic Considerations

1. Facial-Lingual Displacement
2. Axial Inclination of Teeth
3. Fibrous Gingival Hyperplasia
4. Frena
5. Tooth Size

B. Treatment Options

1. Primary Dentition - Treatment Rarely Indicated
2. Mixed Dentition - Fixed or Removable Orthodontic Appliance
3. Adolescent Dentition - Fixed or Removable Orthodontic Appliance
III. Discrepancies of Arch Form

A. Diagnostic Considerations

1. Asymmetry
2. Interarch Coordination
3. Abnormal Occlusal Planes: Curves of Wilson and Spee

B. Treatment Options

1. Primary Dentition - Fixed or Removable Orthodontic Appliance
2. Mixed Dentition
   a. Fixed or Removable Orthodontic Appliance
   b. Functional/Orthopedic Appliance
3. Adolescent Dentition
   a. Fixed or Removable Orthodontic Appliance
   b. Functional/Orthopedic Appliance
4. Adult Dentition
   a. Fixed or Removable Orthodontic Appliance
   b. Fixed Orthodontic Appliance Adjunctive to Orthognathic Surgery

Abnormalities of Tooth Number Morphology, and Eruption Pattern

Anomalies of tooth number, morphology or eruption pattern should be diagnosed and managed as soon as reasonably practical according to the particular requirements of each clinical situation. These conditions may appear in various combinations, and may indicate the need for orthodontic or dentofacial orthopedic treatment. Some of the frequently used treatment options may require a multidisciplinary approach and may include the extraction of primary or permanent teeth.

A. Diagnostic Considerations

1. Supernumerary Teeth
2. Missing Teeth
   a. Congenital (Anodontia)
   b. Pathologic
   c. Traumatic
   d. Extracted
3. Ectopic Erupting Teeth
4. Impacted Teeth
5. Eruption Anomalies
6. Over-Retained Primary Teeth
7. Ankylosed Teeth
8. Transposition
9. Atypical Crown Morphology
10. Premature Loss of Primary Teeth
11. Atypical Root Morphology
12. Root Resorption
13. Carious or Fractured Teeth
B. Treatment Options

1. Supernumerary Teeth
   a. Surgical Intervention
   b. Extraction
   c. Fixed or Removable Orthodontic Appliance

2. Missing Teeth
   a. Space Maintenance
   b. Fixed or Removable Orthodontic Appliance
   c. Prosthetic Replacement of Teeth/Implants
   d. Transplantation
   e. Maintenance of Primary Teeth
   f. Space Closure

3. Ectopic Teeth
   a. Fixed or Removable Orthodontic Appliance
   b. Extraction

4. Impacted Teeth
   a. Surgical Intervention
   b. Extraction
   c. Fixed or Removable Orthodontic Appliance

5. Eruption Anomalies
   a. Surgical Intervention
   b. Retention with or without Coronal Modification
   c. Extraction
   d. Fixed or Removable Orthodontic Appliance
   e. Referral for Medical Evaluation

6. Over-Retained Primary Teeth Extraction
   a. Extraction

7. Ankylosed Teeth
   a. Extraction
   b. Surgical Luxation
   c. Surgical Repositioning
   d. Fixed or Removable Orthodontic Appliance
   e. Retention with or without Coronal Modification

8. Transposition
   a. Fixed or Removable Orthodontic Appliance
   b. Extraction
   c. Retention with or without Coronal Modification
   d. Transplantation

9. Atypical Tooth Morphology
   a. Retention with or without Coronal Modification
   b. Extraction
   c. Fixed or Removable Orthodontic Appliance

10. Premature Loss of Primary Teeth
    a. Space Maintenance
    b. Fixed or Removable Orthodontic Appliance

11. Atypical Root Morphology
    a. Monitor Radiographically
    b. Extraction

12. Root Resorption
    a. Monitor Radiographically
b. Extraction

c. Stabilization

13. Carious or Fractured Teeth
- a. Reposition Tooth or Root
- b. Fixed or Removable Orthodontic Appliance

**Dentofacial Functional Abnormalities**

55 Dentofacial functional abnormalities may occur in combination with other dentofacial conditions and should be diagnosed and managed according to the particular requirements of each clinical situation. Correction or control of functional problems may involve alteration of behavior patterns, may require orthodontic/dentofacial orthopedic treatment, or multidisciplinary treatment. The influence of functional abnormalities on dentofacial development is variable, and cause and effect relationships are difficult to determine.

**A. Diagnostic Considerations**

1. Lip Size and Function
2. Tongue Size and Function
   - a. Abnormal Tongue Function
   - b. Ankyloglossia
   - c. Microglossia or Macroglossia
3. Deleterious Habits
   - a. Thumb, Finger or Lip Sucking
   - b. Pacifier Sucking
   - c. Tongue Thrust/Sucking
   - d. Clenching
   - e. Grinding
   - f. Lip/Cheek Biting
   - g. Nail Biting
   - h. Foreign Objects (e.g., pipes, pens, pencils, musical instruments)
4. Airway Obstruction
   - a. Nasopharyngeal Morphology
   - b. Sleep Apnea
   - c. Allergies
   - d. Pathology
5. Speech Disorders
6. Mandibular Dysfunction
   - a. Dental Interferences
   - b. Skeletal Abnormalities
   - c. Neuromuscular Abnormalities
   - d. Temporomandibular Dysfunction
7. Temporomandibular Disorders

Temporomandibular disorders represent a broad range of conditions which involve medical, dental, and psychological factors. Such disorders may be associated with stress, habits, emotional disorders, structural malrelationships, trauma to the face or head, occlusal disharmonies, and medical problems associated with osteoarthritis, rheumatoid arthritis, or viral disease. These factors may be associated with temporomandibular disorders in one individual with no symptomatology or pathology in another.
B. Treatment Options

1. Lip Size and Function
   a. Fixed or Removable Orthodontic Appliance
   b. Therapeutic Exercises
   c. Functional/Orthopedic Appliance
   d. Surgery

2. Tongue Size and Function
   a. Fixed or Removable Orthodontic Appliance
   b. Therapeutic Exercises
   c. Functional/Orthopedic Appliance
   d. Surgical Reduction
   e. Lingual Frenectomy

3. Deleterious Habits
   a. Fixed or Removable Orthodontic Appliance
   b. Functional/Orthopedic Appliance
   c. Behavior Management

4. Airway Obstruction
   a. Medical Evaluation/Treatment
   b. Functional/Orthopedic Appliance
   c. Orthognathic Surgery

5. Speech Disorders
   a. Fixed or Removable Orthodontic Appliance
   b. Referral for Evaluation/Treatment

6. Mandibular Dysfunction
   a. Occlusal Equilibration (Modification of Tooth Form)
   b. Fixed or Removable Orthodontic Appliance
   c. Fixed Orthodontic Appliance Adjunctive to Surgery
   d. Functional/Orthopedic Appliance

7. Temporomandibular Disorders
   Numerous treatment modalities, including orthodontics, have produced beneficial results in the management of temporomandibular disorders. However, no singular treatment modality may necessarily be definitive for any particular patient. There is no scientific proof that any particular method of orthodontic treatment, whether involving extraction or non-extraction, has any causative effect on temporomandibular disorders. There is no reliable method for predicting or preventing future temporomandibular disorders in any particular individual.

Craniofacial Anomalies, Cleft Lip and Palate

Management of patients with these and other anomalies is, in many cases, best provided by a multidisciplinary team of dentists and physicians. The optimal time for the first evaluation of these patients is within the first few days of life, and referral for team evaluation and management is appropriate at any age. Treatment plans should be developed and implemented on the basis of team recommendations. The orthodontist, as a member of the craniofacial defects team, should evaluate those factors that may influence surgical management, assist in treatment planning, obtain baseline diagnostic records and perform orthodontic treatment.

For patients at risk for developing malocclusion or maxillomandibular discrepancy, diagnostic records should be collected at appropriate intervals. Depending on the goals to be accomplished, periods of treatment and retention may be necessary beginning at birth. For example, patients with cleft lip and cleft palate may require presurgical maxillary orthopedics to improve the position of
the maxillary alveolar segments prior to lip and palate closure. Timing of bone grafting of alveolar
crests should be determined by the stage of dental development and with the collaboration of the
orthodontist and surgeon.

Treatment Objectives and Limiting Factors

Goals

The goals of orthodontic treatment are optimum dentofacial function, health, stability and esthetics.
While these goals are desirable, it should be recognized that individual patients have problems,
concerns and conditions which may prevent the attainment of optimal results in every case, and
that the non-attainment of some of the goals of orthodontic treatment in a particular patient is no
indication of negligence by the orthodontist even when no limiting factors are present. Some
patients may simply wish to pursue more limited treatment goals.

Limiting Factors

Orthodontic treatment results may be affected by extenuating circumstances beyond the
practitioner's control. These limiting factors should be documented in the patient's record when
they occur and the patient/guardian should be informed. The following are some of the more
common limiting factors affecting orthodontic therapy:

1. Severity of the pretreatment condition
2. Pretreatment agreement to pursue limited objectives
3. Abnormal skeletal morphology or growth, during or after treatment
4. Abnormal size, shape, or number of teeth
5. Aberrant tooth eruption patterns
6. Patient's failure to initiate timely treatment, continue or complete treatment
7. Compromised periodontal tissues
8. Persistent deleterious habits or abnormalities of muscle function relating to the
dentofacial complex
9. Inability or unwillingness of the patient to cooperate with treatment (e.g., the wear
and/or care of appliances, oral hygiene measures, diet, or keeping appointments)
10. Failure to complete all recommended aspects of treatment
11. Poor quality, untimely or inappropriate integration of other recommended or
required dental and/or medical services
12. Medical complications or underlying systemic conditions
13. Patient transferring to another provider during orthodontic treatment
14. Patient transferring from another provider where the previous treatment plan limits
the quality of outcome
15. Incomplete correction or relapse of orthognathic surgical procedures

Treatment Consultation and Informed Consent

A discussion must be held with the patient/parents/legal guardian utilizing lay terminology to
provide sufficient information for the responsible party to accept or reject the proposed treatment
plan. This discussion must be documented and should include:

1. A description of the diagnosis and treatment plan.
2. A discussion of reasonable alternative treatments.
3. The relevant risks, compromises, and limitations associated with the proposed treatment plan and alternative treatments.

4. A discussion of any portion of the treatment plan that will require the services of other dental or medical health care providers and the anticipated effects of such services on the orthodontic treatment plan.

5. The prognosis related to all treatment plans, including the option of no treatment.

6. A discussion of the patient's responsibility relating to the care (e.g., maintaining periodic recall visits with their general dentist).

7. An estimate of the duration of active treatment and retention.

8. A signed agreement regarding informed consent and the financial arrangements may be considered.

Risks Associated with Orthodontic Treatment

All forms of medical and dental treatment, including orthodontics, involve some risks and/or limitations. Fortunately, in orthodontics, serious complications are infrequent. The orthodontist should determine which potential risks to disclose to the patient in the exercise of sound professional judgment given the clinical condition of the patient. Due to the length of orthodontic treatment, conditions may arise which are coincident, but not caused by orthodontic treatment.

Some of the risks associated with orthodontic treatment include:

1. Tooth decay, or permanent markings (decalcification).

2. The length of the roots of teeth may become shortened. This may be of no clinical significance or may require the discontinuance of orthodontic treatment with subsequent interdisciplinary treatment to stabilize the teeth. In some cases root shortening may be pre-existing.

3. The health of the bone and periodontal support of the teeth may be affected.

4. The teeth and/or jaws have a tendency to change their positions after treatment.

5. Temporomandibular joint problems may appear concurrently with orthodontic treatment, but may not be related to the treatment.

6. The vitality of a tooth may be compromised.

7. Orthodontic appliances may irritate or damage the oral tissues and may cause injury if accidentally swallowed or aspirated.

8. Dental materials, instruments, and equipment may result in damage or injury to the oral tissues, face and/or eyes.

9. Accidents during treatment or patient misuse of orthodontic appliances may result in injury to the oral tissues, face and/or eyes.

10. Oral surgery, orthognathic surgery or other adjunctive medical, surgical or dental procedures may be necessary in conjunction with orthodontic treatment. Associated treatments carry additional risks which must be discussed with the patient/parents/legal guardian by the health care practitioner providing the service.

11. Orthodontic appliances may cause attrition, flaking or fracturing of tooth structure.

12. When orthodontic appliances are removed, fracture and/or damage to the teeth may result.

13. Medical or psychosocial conditions may result in compromised results or dissatisfaction with treatment.

14. Orthodontic materials may cause allergic reactions in some individuals.

15. Patients may be dissatisfied with their dental or facial esthetics at the conclusion of treatment due to unrealistic expectations or perceptions.

16. Abnormal growth during or after treatment may produce undesirable results.
17. Treatment time may be extended and results compromised due to unforeseen circumstances and poor patient cooperation.

18. Tooth movement during orthodontics may be adversely affected for patients receiving bisphosphonates. Bisphosphonates have the potential to slow tooth movement and may lengthen treatment time. The effects of these medications may be severe enough to stop tooth movement which may result in removal of appliances regardless of tooth positions. The effects of bisphosphonates on an individual are not predictable. Long-term bisphosphonate use has been observed to decrease bone healing. It is possible that tooth movement and any surgery procedures within the jaws or bone surrounding the teeth may be difficult, and in some cases may result in osteonecrosis of the jaws.

19. The use of orally applied drugs, especially certain drugs of abuse such as cocaine or amphetamines, may seriously compromise the gums and bone tissue around teeth which can be exacerbated by orthodontic treatment.

Risks Associated with Adjunctive Procedures in Orthodontics

The orthodontist may recommend certain procedures that are intended to enhance or facilitate the positive outcome of orthodontic therapy (i.e. temporary anchorage devices, soft tissue laser treatment, etc.). These procedures may involve certain risks and limitations, all of which may involve additional informed consent issues.

Post Treatment Evaluation and Outcomes Assessment

The effects of orthodontic treatment should be evaluated retrospectively with reference to the pretreatment condition. Consistent re-evaluation of treatment results along with continued review of treatment modalities and their effectiveness will serve to provide the public with the highest quality of orthodontic care. Assessing the outcome of treatment is dependent upon the treatment goals and objectives, the condition being treated, the stage of the patient's dentofacial development, and the treatment provided. Limiting factors must be considered when evaluating treatment and outcomes.

Post Treatment Records

Post treatment unaltered records provide information for the quantitative and qualitative assessment of treatment changes as well as for education, research, and quality assurance. Post treatment records may include, but are not limited to:

1. Extra and intraoral images (digital, still or video images)
2. Dental casts (hard copy or digital format)
3. Intraoral, panoramic, and/or cephalometric radiographs (CBCT as an alternative)
4. Other indicated procedures or tests

Positive Outcomes of Treatment

1. Satisfaction of the patient's chief complaint
2. Well aligned teeth
3. Good or improved occlusal function
4. Good or improved dental and facial esthetics
5. Good or improved environment for dentofacial development
6. Desirable modification of the size, shape, and position of the jaw(s)
7. Stability of the treatment results
8. Good or improved dental and periodontal health
9. Good or improved temporomandibular function

Negative Outcomes of Treatment

1. The patient's chief complaint was not satisfied
2. Poorly aligned teeth
3. Poor or unimproved occlusal function
4. Poor or unimproved dental and facial esthetics
5. Premature root resorption (primary teeth)
6. Excessive root resorption (permanent teeth)
7. Loss of periodontal support
8. Clinically significant decalcification or dental caries
9. Unsatisfactory modification of the size, shape, and position of the jaws
10. Instability of the treatment results
11. Poor or worsened temporomandibular function

Retention

1. A retention plan must be established after reviewing the patient's original condition, treatment objectives, the results achieved, and/or any limiting factors.
2. Completion of orthodontic treatment does not ensure the stability of the result. Future treatment may be recommended when post treatment changes occur and may be due to growth, maturation, aging, lack of compliance with the retention protocol, periodontal problems, oral habits and post treatment trauma, among other factors.

Record Keeping

The keeping and preserving of a patient's dental record is necessary to the goal of providing high quality orthodontic treatment. Prudent record keeping is the foundation for planning and maintaining the continuity of patient care. It also provides documentary evidence of the evaluation and diagnosis of the patient's condition, the treatment plan, the treatment provided, referrals made, and follow up care. It also documents communications with the patient, other health care providers and any other third parties. The dental record also protects the legal interests of all parties. In addition, a patient's dental record may provide material for continuing education, research, administrative oversight, billing, and quality assurance.

1. Treatment procedures, changes in the treatment plan, patient compliance, treatment difficulties, and other important aspects of treatment must be recorded and maintained. Copies of related correspondence and appropriate release forms must also be maintained as part of the patient's record.
2. Documentation must be written, dictated, or computer annotated; maintained concurrently; and kept chronologically.
3. The original records are usually considered the property of the practitioner. Laws regarding patient record access, duplication and transfer vary from state to state. Practitioners can obtain clarification from their state regulatory agency.
4. Electronic/digital records have the potential to be altered. Alteration of original electronic/digital records must be avoided. Credible computer software either prevents this or records any alteration of an original electronic/digital record.
However, enhancement of images is allowed as long as these are duly labeled and saved as separate images. Enhancement of other electronic/digital records, such as radiographs, to enable better identification of landmarks and/or dentoskeletal anomalies is permissible; however, the original cannot be altered. It is the responsibility of the practitioner to protect the sanctity of all patient records as prescribed by all local, state and federal laws.

Transfer of Orthodontic Patients

Because of the time required to complete orthodontic treatment, the transfer of care from one practitioner to another occurs frequently.

Recommendations to the Transferring Practitioner

1. Practitioners should attempt to arrange for the continuation of orthodontic treatment of their patients with as little interruption as possible. Regardless of the reason for transfer, reasonable efforts of both the transferring and accepting practitioner are necessary to effect an orderly transfer. It is recommended, and in some states required, to obtain a written release from the patient/parents/legal guardian prior to the transfer of the patient's records. It is preferable to send copies of the pertinent records directly to the new practitioner. The use of electronic media may facilitate this process. It is acceptable, but less desirable, to provide these records to the patient/parents/legal guardian. A patient's records should not be withheld due to an outstanding balance.

2. The transferring practitioner should ensure that all appliances are in good order. The patient/parents/legal guardian should be advised that extended periods of active orthodontic treatment without supervision can be detrimental, and an appointment with the new practitioner should be scheduled as soon as possible.

3. The patient/parents/legal guardian should be informed that there may be different approaches to treatment by different practitioners.

4. The patient/parents/legal guardian should be informed that there may be different fees with treatment by different practitioners.

5. The transferring practitioner should make no statements that would undermine the establishment of a sound doctor-patient relationship with the accepting practitioner.

6. The transferring practitioner should be available for consultation by the accepting practitioner.

7. The transferring practitioner should provide appropriate financial information in advance or immediately upon request to the accepting practitioner.

Recommendations to the Accepting Practitioner

1. The accepting practitioner should review the patient's records, including the previous financial arrangements if available, prior to the development of a plan for continuation of treatment. In addition, the estimated time required to complete treatment and the financial arrangement for continuation of treatment should be discussed as soon as possible. Patients should be informed about their present oral health status without unprofessional comments about prior treatment.

2. Appropriate records documenting the status of the case at the time of transfer should be made.
3. A practitioner is not obligated to accept an orthodontic transfer patient. If a practitioner is unable or unwilling to accept the transfer patient, the practitioner may assist the patient/parents/legal guardian in finding another practitioner.

4. At the patient/parents/legal guardian’s request, a practitioner may remove appliances from a patient not of record. If appropriate, previous practitioners should be consulted.

Patients Who Wish to Transfer because of Dissatisfaction with Current Orthodontist

Recommendations to the transferring practitioner

1. If it becomes known that a patient plans to leave an orthodontist’s practice for another, the orthodontist should provide the name(s) of other orthodontists in the area.

2. Upon the patient’s written request, copies of all treatment records and appropriate financial records should be forwarded to the accepting orthodontist, or to the patient, if requested. The original treating orthodontist should retain all original records. A reasonable and fair fee can be charged for record duplication. Treatment records cannot be withheld because the patient/guardian has an outstanding balance.

Recommended procedures for accepting orthodontist

1. Check to verify the patient received a copy of “Advice for the transferring orthodontic patient” form from the transferring orthodontist. If not, the patient should be given a copy.

2. Request copies of all treatment records and appropriate financial records and the AAO transfer form from the referring orthodontist.

3. Document thoroughly the patient’s condition on starting treatment in the practice.

4. Be candid in assessing treatment progress to date. The orthodontist should refrain from any unnecessary remarks about the previous treatment that could be construed as negative.

5. If unable or unwilling to accept transfer patients, consider referring the patient to another AAO member.

Members should be aware of the following documents written by the AAO Legal Counsel:

1. Second Opinions
2. Terminating the Doctor/Patient Relationship
3. Patient Records and Record Keeping

Evidence-Based Dentistry

Definition

Evidence-based dentistry (EBD) is an approach to oral health care that requires the judicious integration of systematic assessments of clinically relevant scientific evidence, relating to the patient’s oral and medical condition and history, with the dentist’s clinical expertise and the patient’s treatment needs and preferences.
Levels of Evidence

Hierarchical rating systems exist to grade individual or multiple studies based on the type of study design and effectiveness in answering a specific question. Evidence levels follow a structured hierarchy of criteria for grading strength of evidence, and some include assessment of the study’s methodological quality, precision of statistical data for the population being studied (internal validity), and other considerations.

Examples of evidence ranging from a high to low-level:

- Meta-analysis
- Systematic Review
- Randomized Trial
- Cohort Study
- Case/Control Study
- Case Series
- Expert Opinion

Best Evidence

The highest level of evidence available represents the current best evidence for a specific clinical question. Based on a hierarchy of levels of evidence, meta-analysis and systematic reviews of randomized controlled trials constitute the highest levels of current best evidence, and expert opinion the lowest level of evidence.

Evidence-Based Clinical Recommendations

Evidence-Based clinical recommendations are developed through critical evaluation of the collective body of evidence on a particular topic to provide practical applications of scientific information that can assist orthodontists in clinical decision-making. In addition to scientific journals, dental schools, and approved courses, sources of this information may be found in the following locations:

1. Cochrane Collaboration
   - An international nonprofit organization that develops evidence-based systematic reviews on health care interventions

2. MEDLINE™
   - The National Library of Medicine’s searchable database of over 12 million indexed citations from more than 4,600 medical, dental, health and scientific journals Additional information is available through the AAO Library.

HIPAA

Under the new rules, orthodontists may “use” and “disclose” a patient’s “protected health information” only as the patient permits or as allowed under the privacy rules. Even where the use and disclosure of such information is permissible, orthodontists must adopt policies and
ATTACHMENT A

procedures to safeguard and limit the use and disclosure of the information to the “minimum necessary” level required to accomplish the intended purpose of the use or disclosure.

In the context of this law, “protected health information” is “individually identifiable information” and includes names, dates, phone/fax numbers, email addresses, home addresses, social security numbers, and demographic data. Employment records are excluded from the definition unless used in connection with the provision of treatment.

The use or disclosure of the information for any purpose requires the patient’s/guardians’ prior written permission except for the purpose of the patient’s treatment, payments activities, and “health care operations”, for the treatment activities of any health care provider, and for payment activities of other covered entities such as insurance companies.

The privacy rules also give patients certain rights (amending their protected health information, the right to an accounting of certain disclosures, etc.). According to the rule, the orthodontist needs to appoint a “privacy official” within the practice and to adopt a privacy policy so internal changes can be implemented and monitored in the practice.

The new security rules require persons and entities covered by HIPAA to assess the potential risks to, and vulnerabilities of, their computer systems, protect against threats to information security or integrity, implement and maintain security measures, and ensure compliance with these safeguards. The specific security rules can be obtained here: at http://www.cms.hhs.gov/HIPAAGenInfo/Downloads/HIPAALaw.pdf

The privacy regulations only apply to health care providers who transmit (or authorize third party to transmit on their behalf) protected health information electronically. The new regulations do not apply to AAO members who transmit information in paper form or via facsimile. The new rules require that appropriate administrative, technical and physical safeguards are put in place for patients’ protection. The orthodontist must designate a privacy official who can develop and implement the privacy procedures and a contact person who is responsible for receiving complaints and can respond on matters concerning privacy. Orthodontists must provide privacy training to their staff members within a reasonable amount of time after commencement of employment and training should be documented. The privacy rules require that orthodontists follow the “minimum necessary” rule (obligating practitioners to make reasonable efforts to use, disclose, and obtain the minimum amount of protected information reasonably required to achieve the intended purpose) in relation to the use and disclosure of protected patient information, and reasonably safeguard such information to limit incidental uses and disclosures.

The AAO website provides further details on the need for a written consent to use protected information for treatment, payment or health care operations. The website also details what the consent form should contain, what new rights are given to patients by the new rules, information concerning the extent of the accounting of disclosure that must be given, information about the type of privacy notice that must be given, and when written authorization from the patient/guardian must be obtained. Practitioners are encouraged to consult the AAO HIPAA Compliance Manual found on the AAO website (http://www.aaomembers.org/legal/hipaa).
Appendix A

Historical Development

At its November 1993 meeting, the AAO Board of Trustees directed the AAO Council on Orthodontic Health Care (COHC) to study the feasibility of developing clinical practice guidelines for orthodontics. The council met in January 1994 and proposed a business plan for the development of Guidelines, which was considered at the February 1994 meeting of the AAO Board of Trustees. It was the consensus of the AAO Board of Trustees to develop guidelines utilizing the expertise within the AAO. A task force was appointed. (Appendix A)

The task force met three times between July 1994 and January 1995 and wrote draft guidelines. A copy of draft guidelines was sent to all active AAO members in April 1995 for review. Open forums were held at the 1995 AAO Annual Session and at the meetings of all eight AAO constituent societies during August-November 1995. The task force met again in December 1995 to revise the draft guidelines based on feedback received in 1995. The December 1995 revised draft guidelines were widely circulated in January 1996 for comment. The task force reviewed the comments and a revised draft of the guidelines was distributed to the AAO House of Delegates members, the Board of Trustees and other leaders of organized orthodontics in April 1996. An open forum was held at the 1996 AAO Annual Session for comments on the revised draft guidelines. The revised draft guidelines were approved by the Board of Trustees, a House of Delegates Reference Committee and by the House of Delegates. The Clinical Practice Guidelines were printed in 1996 and were made available to AAO members.

The Board of Trustees decided at their May 2007 meeting to appoint a task force to review and recommend changes to the AAO document “Clinical Practice Guidelines for Orthodontics and Dentofacial Orthopedics 2001.” The 2008 Guidelines will be made available on the AAO members’ website so they will be more easily accessible. The task force was also asked to recommend a protocol to regularly update these Guidelines.

The task force members were assigned in September 2007 (Appendix C). Conference calls and emails between November 2007 and June 2008 were used to make edits and additions to the 2001 Clinical Practice Guidelines. When all changes have been fully discussed and agreed upon by the task force members, they will be circulated to all AAO Councils for input. The task force will then consider whether or not any additional changes are to be made prior to approval by legal counsel and the Board of Trustees.
Appendix B

Updating of Clinical Practice Guidelines

The American Association of Orthodontists considers its Clinical Practice Guidelines to be a living document. The existence of this document is intended to stimulate improvement in the practice of orthodontics by identifying areas where knowledge is incomplete or inadequate. The AAO recognizes the dynamic nature of orthodontics and dentofacial orthopedics and the necessity for updating the guidelines to reflect the evolving science and art of orthodontics.

Revisions to the document, with opportunities for AAO member input, will be made to reflect increasing knowledge and experience. This will take into account future practice developments, basic science and clinical research findings, and clinical data on treatment outcomes. In this manner, the guidelines will continue to evolve and serve as an important resource to the dental profession.

The AAO is committed to revising this document biennially. The AAO President will select an AAO Board member to chair the task force. One council member from three councils will be appointed to the taskforce. Councils providing members to the taskforce will rotate each time the guidelines are updated. An AAO staff member will also be appointed to the task force. The AAO Board of Trustees task force will be authorized to make minor revisions from time to time. The Clinical Practice Guidelines will be an online document only.
Appendix C – Clinical Practice Guidelines Task Force Members

1994 Task Force Members

Dr. Charles S. Tjersland, Chairman
Dr. Rolf G. Behrents
Dr. Thomas J. Cangialosi
Dr. Rodney C. Dubois
Dr. Raymond George, Sr.
Dr. Arnold J. Hill
Dr. Laurance E. Jerrold
Dr. Terry R. Pracht
Dr. Donald R. Poulton, Trustee Liaison
Mr. Terry G. Wolf, Staff Liaison

2007 Task Force Members

Dr. David Turpin, Chair and Trustee Liaison
Dr. Michael Foy
Dr. Jeffery Johnson
Dr. Douglas Klein
Dr. Gary Opin
Dr. Robert Prince
Dr. O.H. Rigsbee
Dr. Emile Rossouw
Dr. Bhavna Shroff
Ms. Jackie Hittner, AAO Staff Liaison

2013 Committee Members

Dr. Christopher Roberts, Chair and Trustee Liaison
Dr. Carolyn Melita (COOP)
Dr. Shannon Owens (COSA)
Dr. Sheldon Seidel (COE)
Ms. Jackie Hittner, AAO Staff Liaison
